

INTRODUCTION

Mercury can cause a variety of harmful health effects. Exposure to mercury can damage the brain, central nervous system and kidneys and is particularly harmful to children. More than 60,000 children born annually are at risk for developmental impairments due to mercury exposure. Don't put your family at risk. Learn how to identify products containing mercury and mercury-free alternatives.

What is mercury?

Mercury is a highly toxic metal that can be found in solid, liquid or vapor form. Most people recognize mercury as a silver liquid used in thermometers and other measuring devices. Mercury also may be found as a solid when combined with other compounds; for example, dentists combine mercury with silver to make fillings. It is used in a wide variety of household, medical and industrial products, including antiseptics, batteries, cosmetics, light bulbs and toys. Liquid mercury also has been sold in botanicas for use in certain folk medicines and cultural practices such as Santeria and Espiritismo.

Health Effects of Mercury

Mercury can enter the body in several ways. It can be inhaled as vapor, ingested through contaminated fish and absorbed directly through the skin. It affects the brain, liver and kidneys and can cause developmental disorders in

children. The type and severity of these health effects depend upon the form and amount of mercury to which you are exposed and how much mercury has accumulated in your body over time. Since mercury can pass from expectant mother to unborn child, women of childbearing years and children, especially those younger than 6, are most susceptible to mercury poisoning.

Environmental Effects

Less than a third of the mercury in the environment occurs naturally. The majority of mercury pollution that enters the air, lakes and streams is preventable. To protect the public health from industrial sources of mercury pollution, New Jersey has taken action to reduce mercury emissions from power plants, iron and steel melters and municipal solid waste incinerators.

Mercury from improper disposal of household products also can pollute our water and air. Improper mercury disposal methods, such as pouring it down drains, putting it in the trash and burning it in barrels and incinerators, can elevate mercury contamination to harmful levels.

When mercury enters lakes and waterways, it undergoes a natural chemical process and is converted to a more toxic form - methylmercury. The methylmercury builds up in the tissues of fish and animals, increasing in concentration as it moves up through the food chain, which results in high levels of mercury in some of the foods we eat. The New Jersey Department of Environmental Protection (DEP) issues annual freshwater fish consumption advisories because of high mercury concentrations in fish. These are available from the DEP's

Web site at www.nj.gov/dep/dsr/njmainfish.htm or by contacting the DEP's Division of Science, Research, and Technology at (609) 984-6070. The U.S. Environmental Protection Agency (EPA) also has issued marine fish advisories for saltwater fish, which are available from map1.epa.gov/.

Household Items Containing Mercury

Many household items contain mercury. When used properly, these items pose no threat to you or your family. However, they can be hazardous if mishandled or improperly discarded. Mercury-free products are available and should be purchased whenever possible.

One exception to the recommended use of mercury-free products is fluorescent lighting. Even though fluorescent lights contain mercury, they are more energy efficient than non-mercury incandescent lights. The increased energy efficiency of fluorescent lights actually results in a reduced amount of mercury emissions from coal-burning power plants. Therefore, fluorescent lights still should be used and be disposed of properly at a household hazardous waste (HHW) collection event.

The following is a list of products containing mercury that may be found in your home and some alternatives:

Consumer Product	Mercury-Free Alternative
Thermometers – silver-colored liquid in glass	Alcohol (red liquid) or digital thermometer tube
Thermostats – all non-electronic	Electronic models
Fluorescent and compact fluorescent lights	No alternative; take lights to HHW collection for disposal
High Intensity Discharge (HID) Lamps – blue-tinted automotive headlamps	Mercury-free HID lamps
Neon Lamps – except the colors red, orange and pink	Mercury-free neon colored lamps
Button-cell batteries – button-shaped batteries usually found in watches, calculators, hearing aides and toys	No alternative; take button-cell batteries to HHW collection for disposal
Alkaline and carbon batteries – manufactured before 1994 and foreign manufactured	Rechargeable or alkaline batteries manufactured after January 1, 1996
Latex paints manufactured before 1991	Latex paint manufactured after 1991. Pre-1991 latex paint should be taken to a HHW collection site for disposal.
Shoes that light up may contain a mercury switch or a button-cell battery	Shoes that do not light up
Electrical switches - used in appliances such as some chest freezers, sump pumps, electric space heaters, clothes irons	Appliances with mechanical or pressure switches
Pilot light sensors on some gas appliances such as stoves, ovens, clothes dryers, water heaters and furnaces	Appliances with mechanical or pressure switches
Antiseptics – thimerosal is used in some contact lens solutions and nasal sprays. Mercurochrome is an old-time antiseptic.	Mercury-free solutions and antiseptics. Ask your pharmacist about alternatives.
Gauges – barometers, manometers, blood pressure and vacuum gauges with silver-colored liquid	Mercury-free gauges
Dental Amalgams – mercury is mixed with other metals for silver dental fillings	Non-mercury fillings made of gold, porcelain, ceramic or plastics. Talk to your dentist.

How do I dispose of products containing mercury?

Products containing mercury should be kept out of the trash. Take them to your county's Household Hazardous Waste Collection Day. A list of contacts for each county is provided on the back page of this pamphlet.

To minimize potential hazards, keep products containing mercury in an airtight, leak-proof container. Keep the container stored out of reach of children and avoid breakage until it can be taken to a collection event.

Spills

If mercury is spilled in your home, **DO NOT VACUUM** the spilled mercury. Vacuuming will spread mercury throughout your home. In the case of a spill, contact your local health department or the New Jersey Department of Health and Senior Services (DHSS) at (609) 984-1863 for clean up guidance. Additional guidance on cleaning up mercury spills is available online from DHSS at www.state.nj.us/health/eoh/survweb/merchome.pdf and from EPA at www.epa.gov/epaoswer/hazwaste/mercury/spills.htm

Businesses

Businesses that generate products containing mercury must manage those products as a universal waste. Information on the Universal Waste Rule is available at www.state.nj.us/dep/dshw or by contacting the DEP's Solid and Hazardous Waste Management Program at (609) 984-6664.

County Household Hazardous Waste Contacts

Atlantic County.....	(609) 272-6950
Bergen County.....	(201) 807-5825
Burlington County.....	(609) 499-5200
Camden County.....	(856) 858-5241
Cape May County.....	(609) 465-9026
Cumberland County.....	(856) 825-3700
Essex County.....	(973) 857-2350
Gloucester County.....	(856) 478-6045 ext. 14
Hudson County.....	(201) 795-4555
Hunterdon County.....	(908) 778-1110
Mercer County.....	(609) 278-8086
Middlesex County.....	(732) 745-4170
