

Diatom-based Models and Indices for Monitoring Nutrient Enrichment in New Jersey Streams

Donald Charles, Karin Ponader

**Patrick Center for Environmental Research, Academy of Natural
Sciences, Philadelphia, PA**

and Thomas Belton

New Jersey Dept. of Environmental Protection, Trenton, NJ

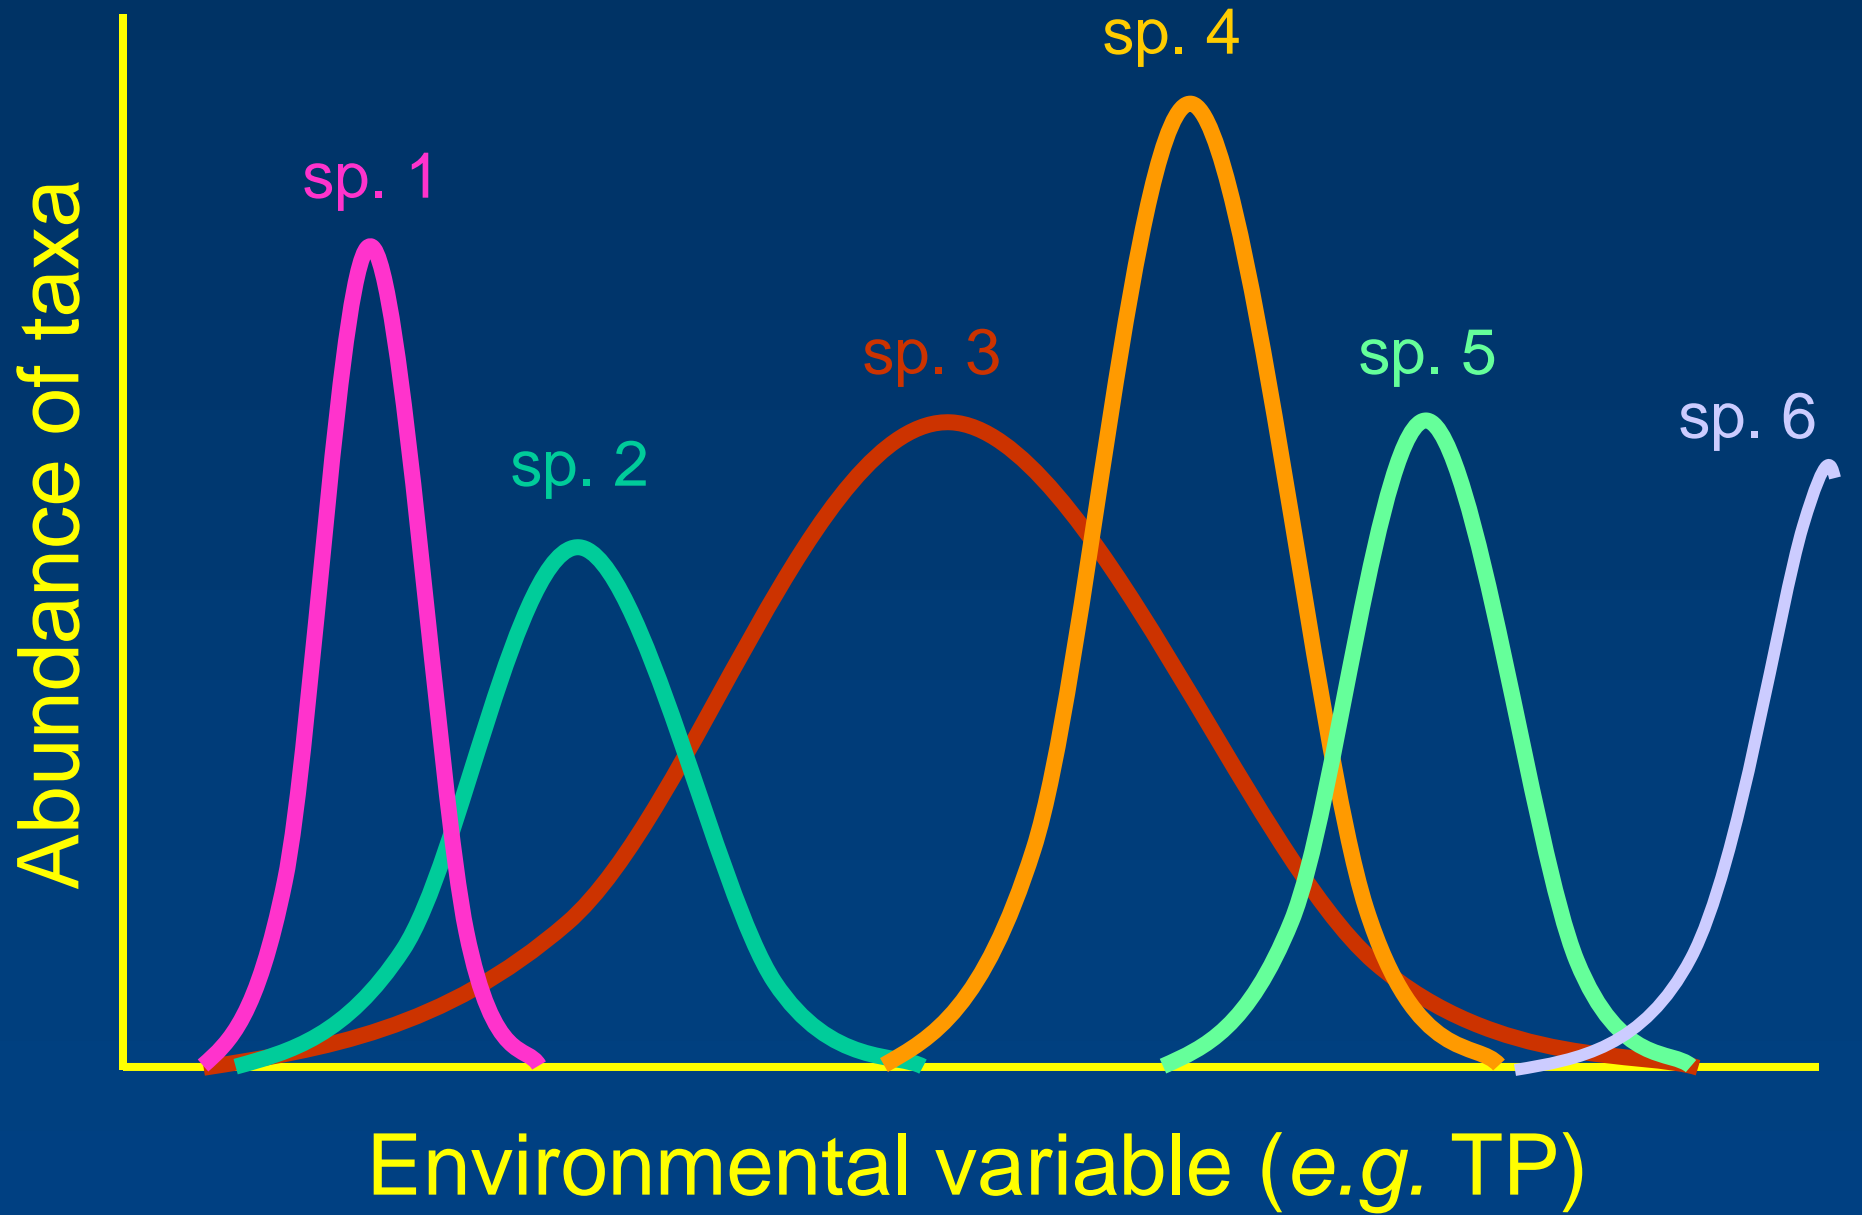

Algal indicators of nutrient conditions

New Jersey needs:

- **Monitoring and regulatory tools**
- **Accurately characterize nutrient enrichment and biological response**
 - determine impairment
 - diagnose cause of impairment
- **Consistent with State nutrient criteria**

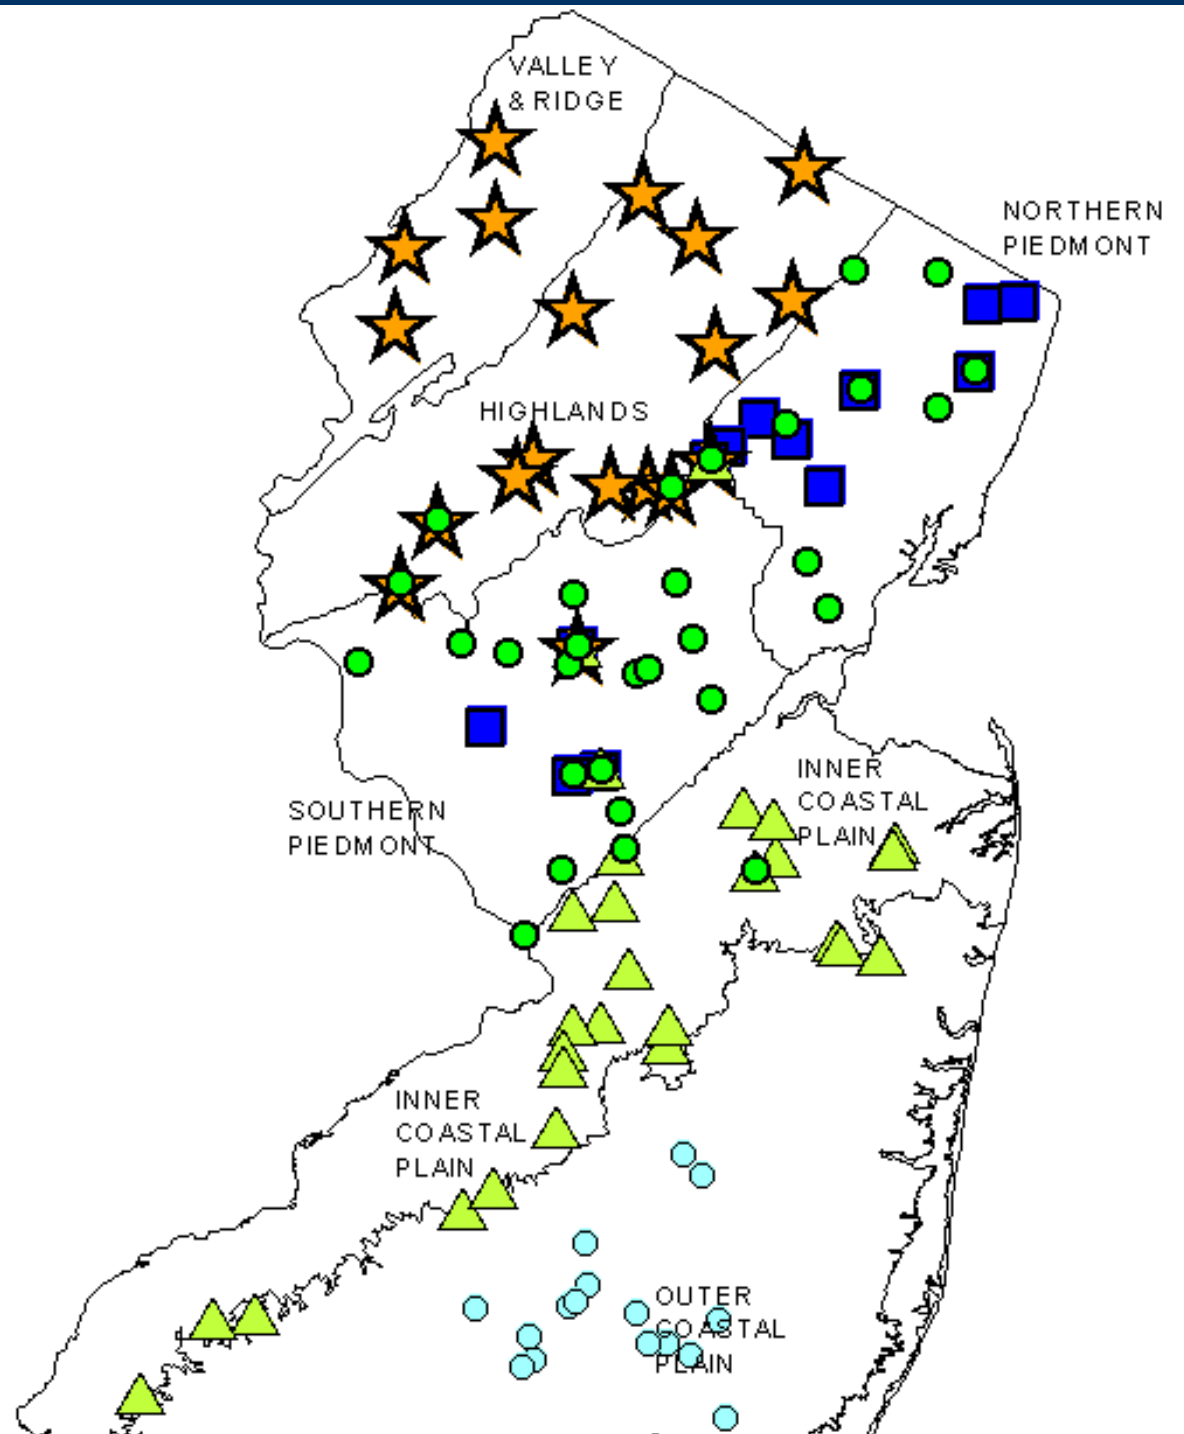

Study sites 2000 – 2004

Piedmont	28
Ridge & Val.	5
Highlands	12
Coastal Plain	34

total:
79 streams,
13
resampled

Study Design

- **Sampling period - August - October**
- **Analyze diatoms, filamentous algae, biomass and water chemistry**
- **Quantify ecological characteristics of taxa**
- **Develop models and metrics**
- **Sample additional sites**
- **Test models and metrics**

Field sampling

- **Width, depth, velocity range**
- **Substrate, canopy cover**
- **Nutrients – several forms of N and P**
- **Composite algal sample for chl *a*, AFDM, and filamentous algae taxa**
- **Composite sample for diatom analysis**
- **Visual estimate of algal abundance along transects**
- **Sample 3 stream Sections first year**

Northern NJ
Sample substrate : rocks

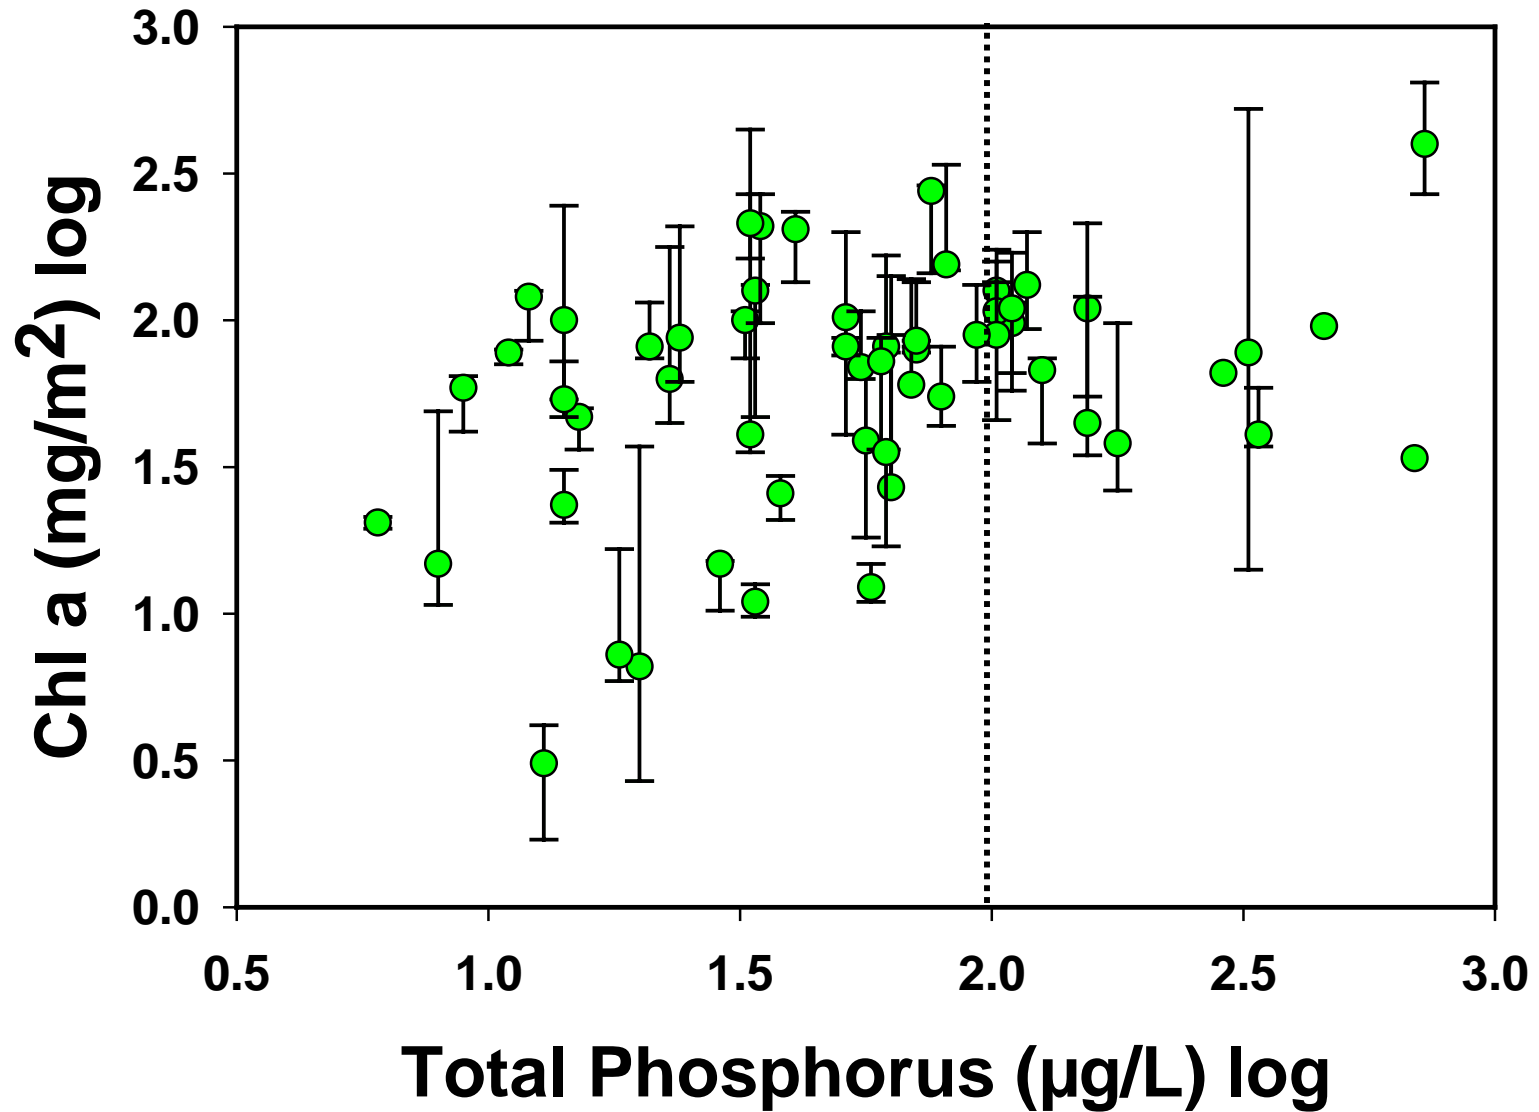

Karin

Southern New Jersey
Sampling Substrate:
Diatometer and
Sand / silt

TP versus Chl a – North. NJ

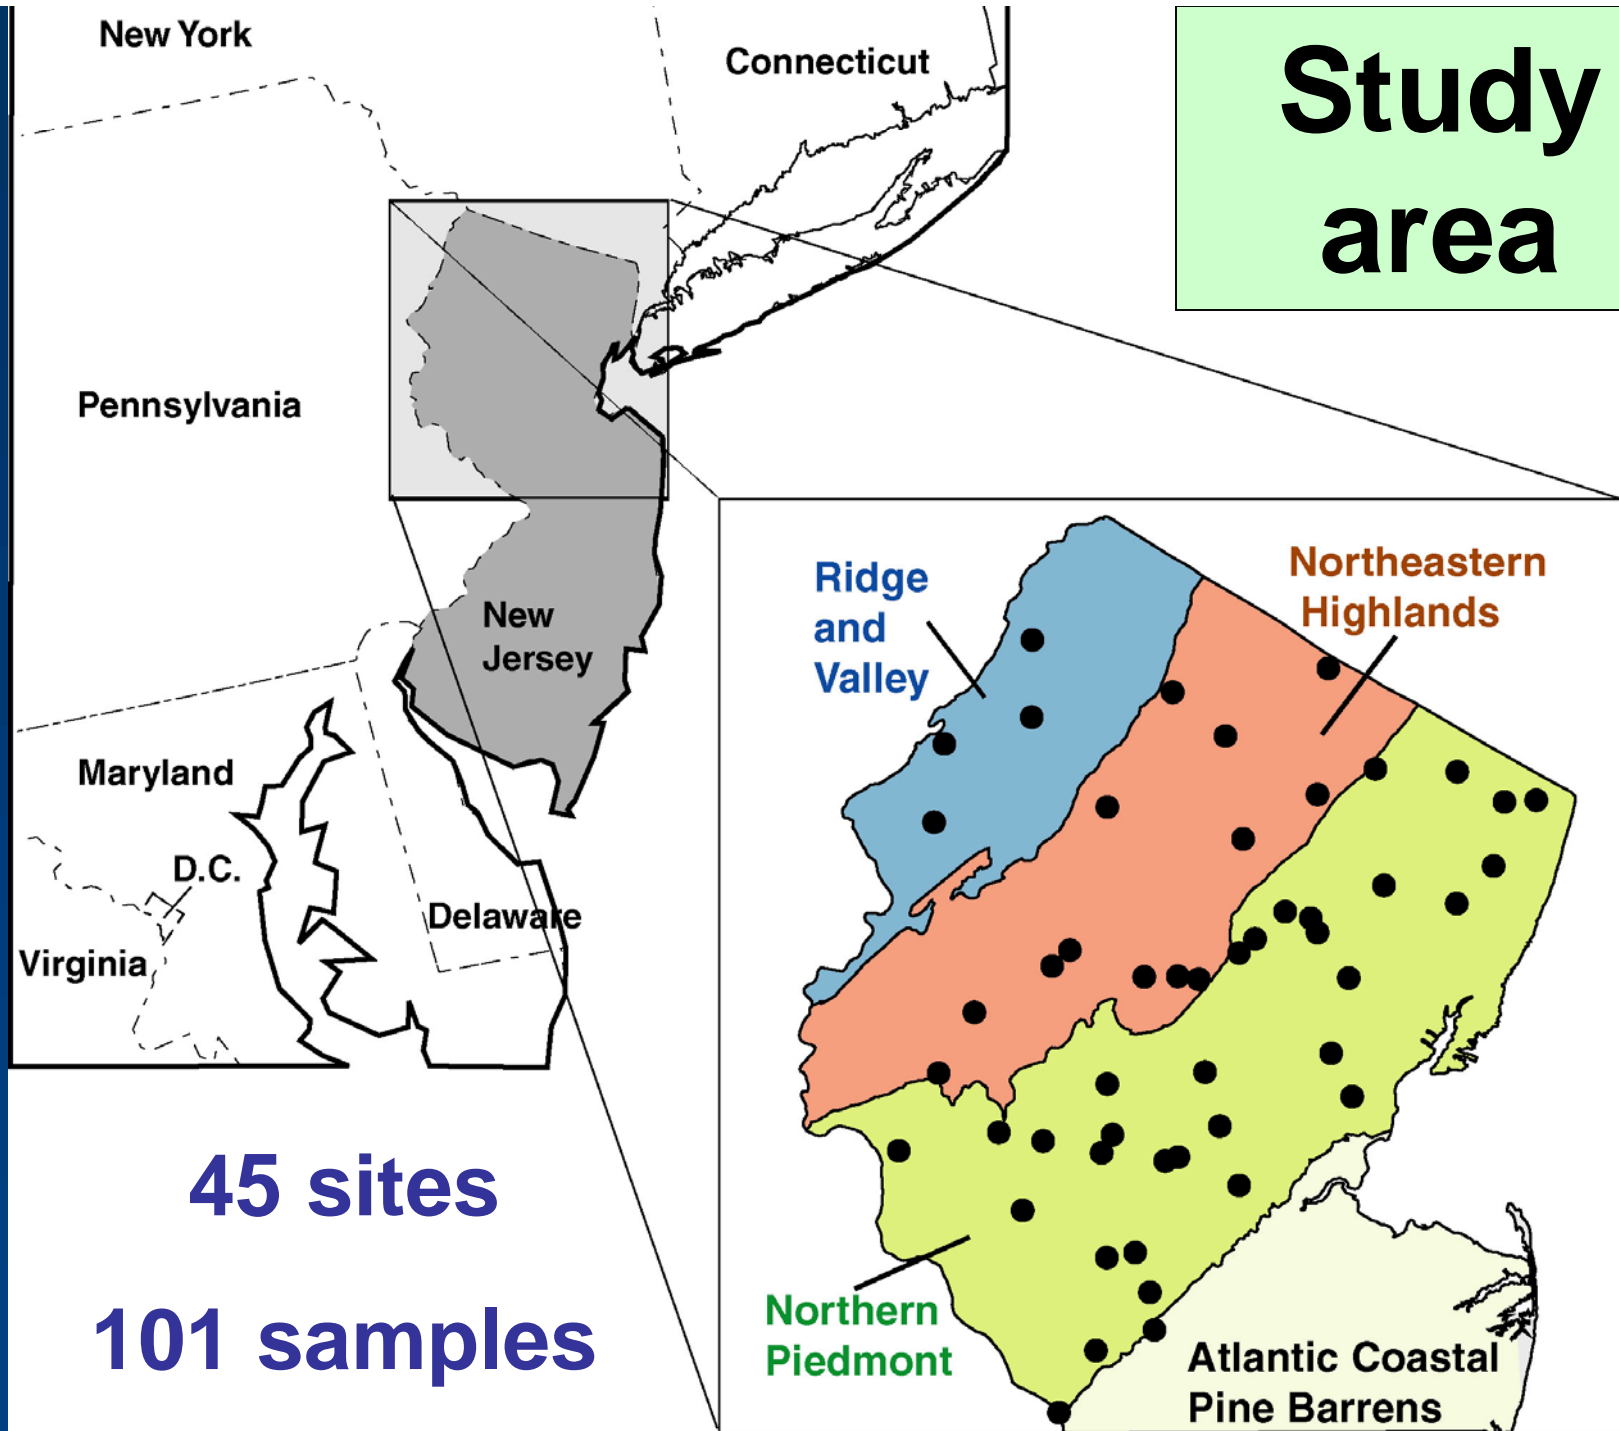

A person wearing a cap, a plaid shirt, and waders is standing in a shallow river. They are holding a white bucket and a clipboard, appearing to be in the process of collecting a water sample. The river is surrounded by dense green trees and bushes. The water is clear, and there are some greenish-yellow patches visible on the riverbed.

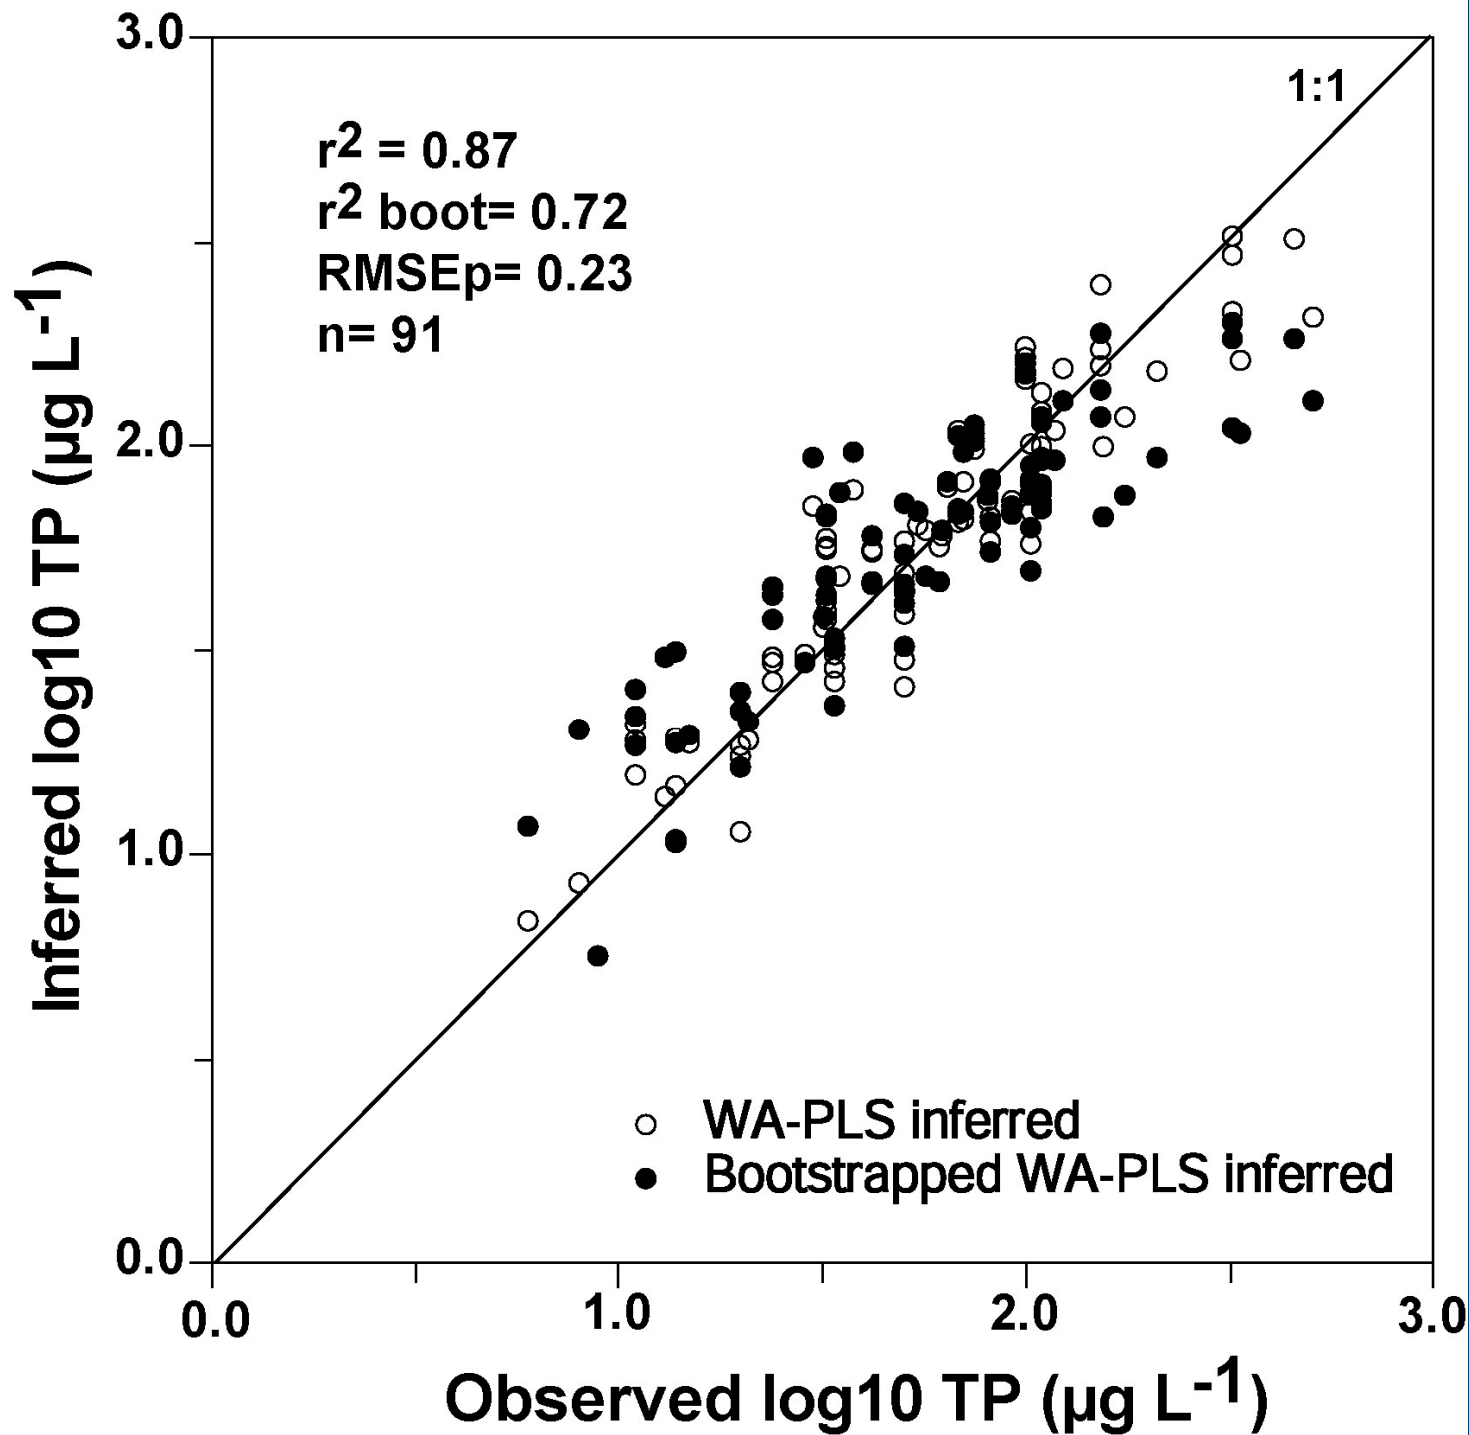

EPA Rapid Bioassessment
Visual Assessment of algal biomass

- Thickness
- Percent cover
- Length of filaments

Study area

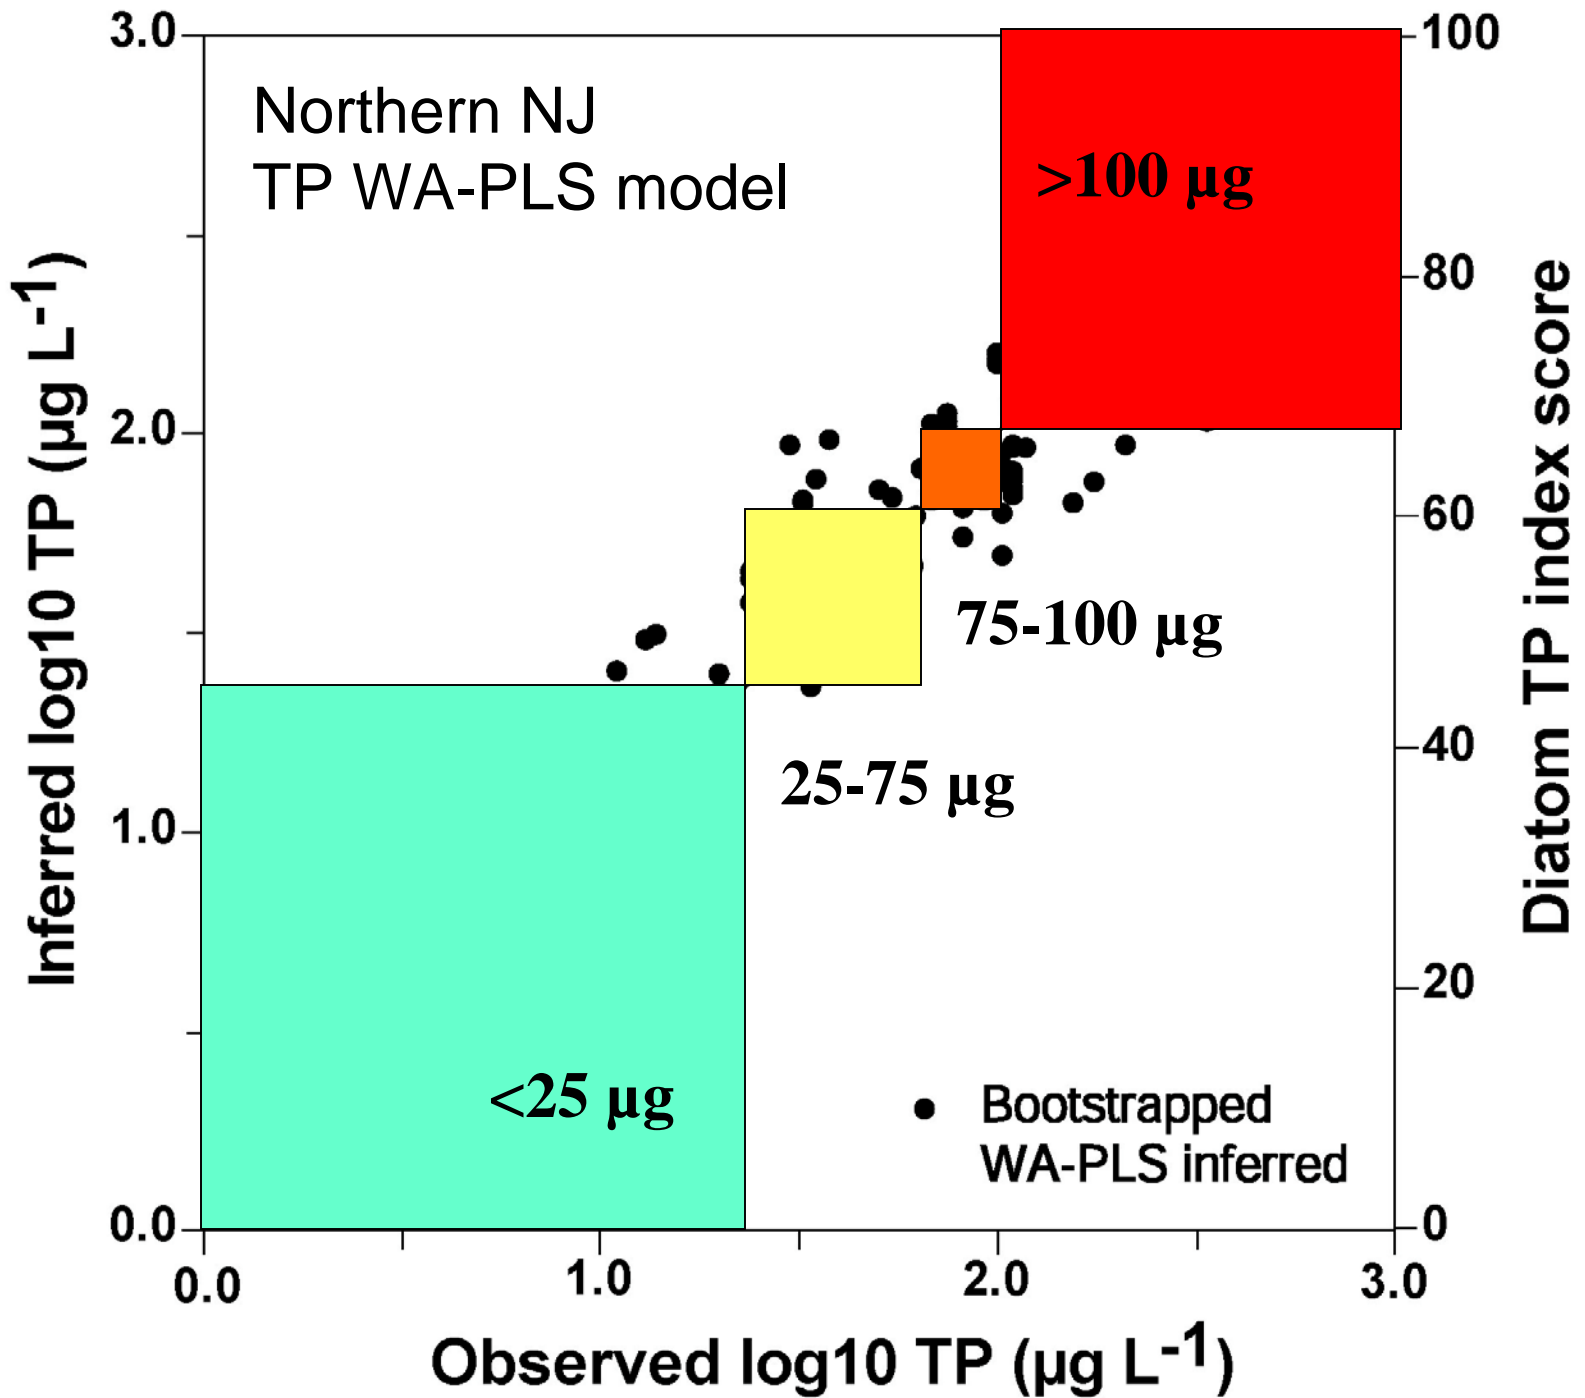

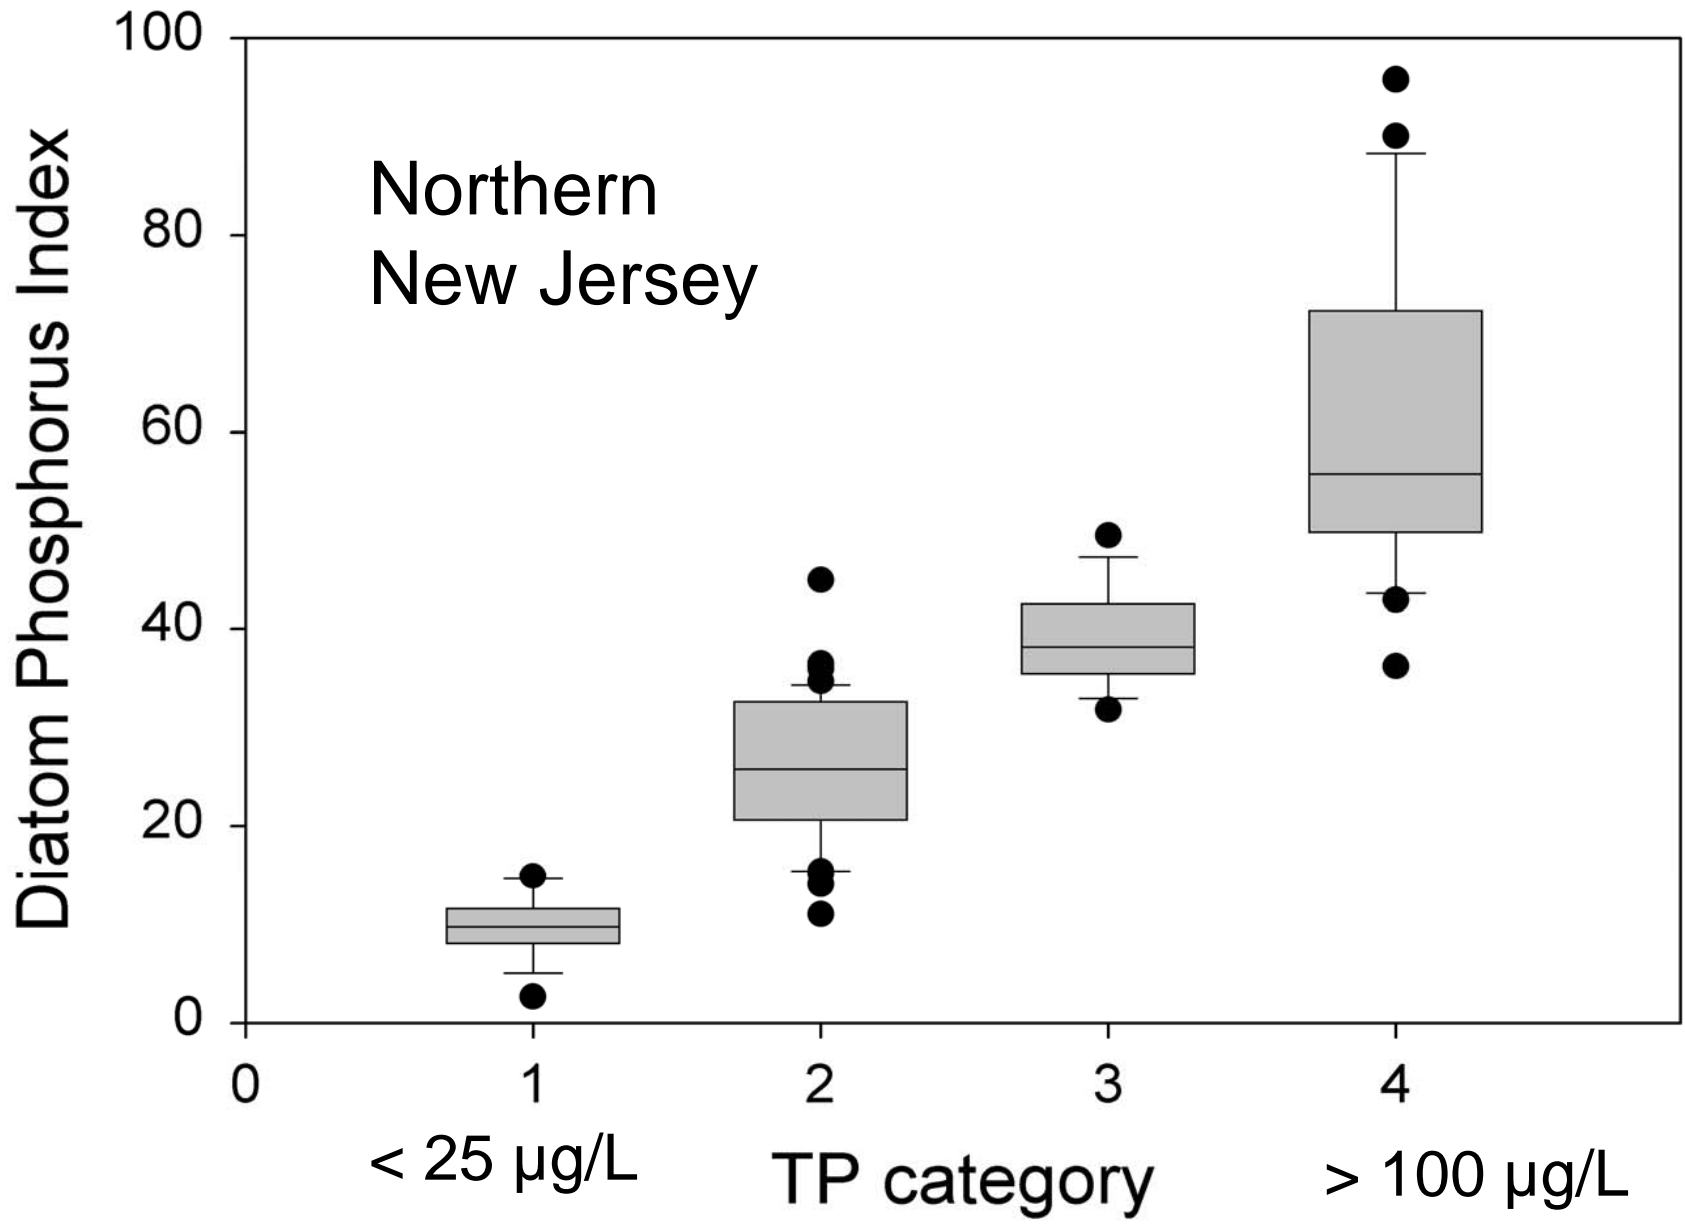

45 sites
101 samples

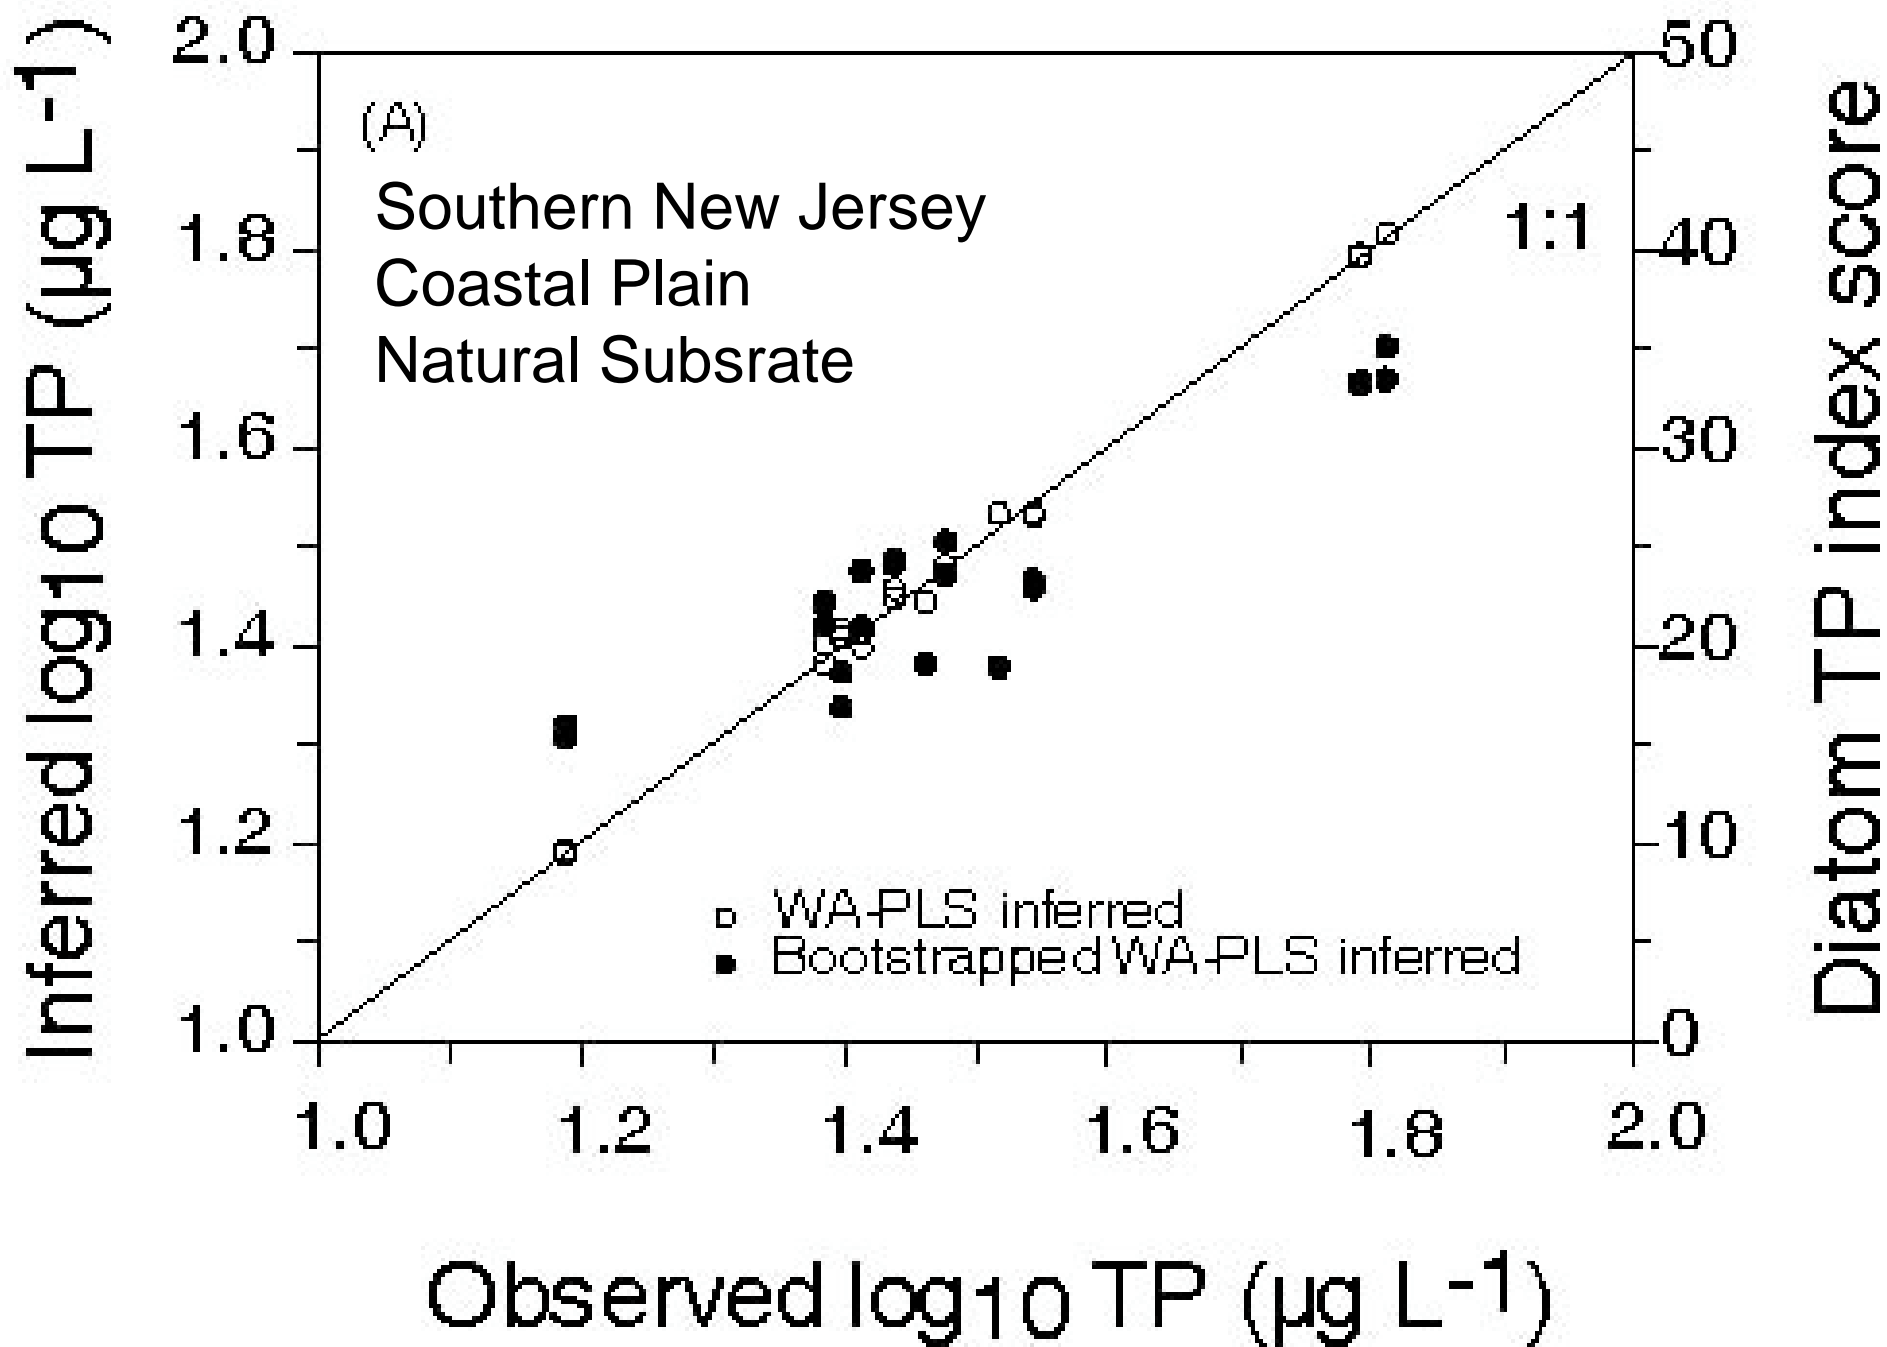

New Jersey

Conclusions

- Diatom nutrient indicators of are ready to use in NJ monitoring and regulatory programs
- Available for all ecoregions
- Protocol manual and diatom taxonomic guide prepared
- Indicators and applications will be improved and refined with use

A photograph of a stream with water flowing over rocks and a sandy bed. The water is clear and reflects the surrounding environment. The rocks are of various sizes and shapes, some partially submerged. The sandy bed is visible in the foreground and middle ground.
