# NJ Living Shorelines Engineering Guidelines Project

Jon K. Miller, Ph.D. Assistant Director NJCPTAS Research Assistant Professor

2015 Living Shorelines and Coastal Restoration Summit Bordentown, NJ - February 27, 2015

©2011 Stevens Institute of Technology

### Literature Review & Gap Analysis

- Designed to summarize what else is out there and what info it contains
- Layout
  - Summarize NJ work
    - White paper, GP, DELSI, Engineering Guidelines
  - What other states are doing
  - Current Initiatives
    - COPRI, NACCS, NNBF, Sage, NYC Research Plan, TNC
  - Gaps
    - Case studies, monitoring, valuation, ice, wakes, specific types of LS

# State Reports and Guidelines

- Alabama (AL)
- Delaware (DE)
- Georgia (GA)
- Maryland (MD)
- Massachusetts (MA)
- Michigan (MI)
- New York (NY)
- North Carolina (NC)
- Rhode Island (RI)
- Texas (TX)
- Vermont (VT)
- Virginia (VA)

**TEVENS** 

• Washington (WA)

# **Engineering Guidelines**

- Primary Objectives
  - Provide guidance to engineers and regulators on the engineering components of living shorelines design
  - Provide a common starting place to ensure consistency with GP 29 (N.J.A.C. 7:7-7.29) – "Living Shorelines GP"
  - Reduce the number of potential failures due to poor design/construction

Living Shorelines Engineering Guidelines

Prepared for:

Draft Report

New Jersey Department of Environmental Protection

Prepared by:

Jon K. Miller, Ph.D., Andrew Rella, Erin Hopson

SIT-DL-14-9-Draft

# Usage

- Engineer knows they're expected to follow guidelines
- NJDEP knows what engineer is expected to consider
- Meant to be "complete", but impossible to include everything
- Not intended to be prescriptive, but rather encourage the innovation that living shorelines projects require
- Designed to be a living document
  - Deficiencies will be brought to light as the guidelines are used
  - Measuring and monitoring will be essential to refining guidance
  - Perhaps combine/integrate with ecological guidelines (?)

# Approach

- 1. Identify factors relevant to living shoreline design
  - Mix of traditional, traditional evaluated non-traditionally, and non-traditional
  - Categorize as system, hydrodynamic, terrestrial, ecological, additional considerations
  - Provide guidance for selecting between alternatives
- 2. Describe approaches for determining required parameters
  - Consider different levels of rigor for different parameters and projects
- 3. Provide example of how these parameters influence design
  - Sills\*, breakwaters\*, joint planted revetment, reef balls\*, living reef\*

\* Marsh creation assumed behind the structures

#### Parameter List

#### **System Parameters**

Erosion History Sea Level Rise Tidal Range

#### Hydrodynamic Parameters

Wind Waves Wakes Currents Ice Storm Surge

#### **Ecological Parameters**

Water Quality Soil Type Sunlight Exposure

#### **Terrestrial Parameters**

Upland Slope Shoreline Slope Width Nearshore Slope Offshore Depth Soil Bearing Capacity

#### **Additional Considerations**

Permits/Regulatory End Effects Constructability Native/Invasive Species Debris Impact Project Monitoring

### Example: Wind Waves

- Along with wakes, typically the dominant cause of erosion
- Both the maximum and the average wave may be of concern
- Basis for most of the critical structural design parameters

### Wind Waves

- Level 1 Analysis
  - Fetch Analysis (average and max)
  - Based on work of Hardaway (1984, 1999)

Energy	Fetch	Weight	Diameter	Sill/Marsh	Width
	(mi)	( <u>lb</u> )	( <u>ft</u> )	BW/Beach	( <u>ft</u> )
Very Low	<0.5	300-900	1.4-2.0	Sill/Marsh	-
Low	0.5 - 1.0	300-900	1.4-2.0	Sill/Marsh	-
Medium	1.0 - 5.0	400-1,200	1.5-2.1	Sill/Marsh	40-70
Medium	1.0-5.0	800-2,000	2.0-2.6	BW/Beach	35-45
High	5.0 - 15.0	2,000-5,000	2.6-3.5	BW/Beach	45-65
Very High	>15.0	2,000-5,000	2.6-3.5	BW/Beach	45-65

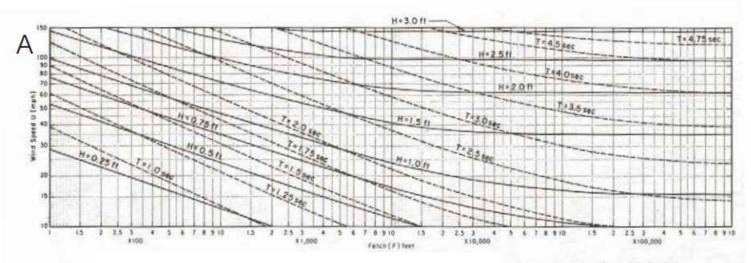

### Wind Waves

- Alternative Level 1 Analysis
  - SMB Type

STEVENS

- Multiple flavors
- Depth limited equations
- Shallow water curves

$$H_{w} = 0.283 \tanh\left[0.530 \left(\frac{gd}{U^{2}}\right)^{0.75}\right] \tanh\left\{\frac{0.0125 \left(\frac{gF}{U^{2}}\right)^{0.42}}{\tanh\left[0.530 \left(\frac{gd}{U^{2}}\right)^{0.75}\right]}\right\}\frac{U^{2}}{g}$$

Constant Depth = 5 feet.

Call in La

STEVENS

### **Selection Criteria**

	Marsh Sill	Breakwater	Revetment	Living Reef	Reef Balls			
System Parameters								
Erosion History	Low-Med	Med-High	Med-High	Low-Med	Low-Med			
Relative Sea Level	Low-Mod	Low-High	Low-High	Low-Mod	Low-Mod			
Tidal Range	Low-Mod	Low-High	Low-High	Low-Mod	Low-Mod			
Hydrodynamic Parameters								
Wind Waves	Low-Mod	High	Mod-High	Low-Mod	Low-Mod			
Wakes	Low-Mod	High	Mod-High	Low-Mod	Low-Mod			
Currents	Low-Mod	Mod-High	Mod-High	Low-Mod	Low-Mod			
lce	Low	Low-Mod	Low-High	Low	Low-Mod			
Storm Surge	Low-High	Low-High	Low-High	Low-High	Low-High			

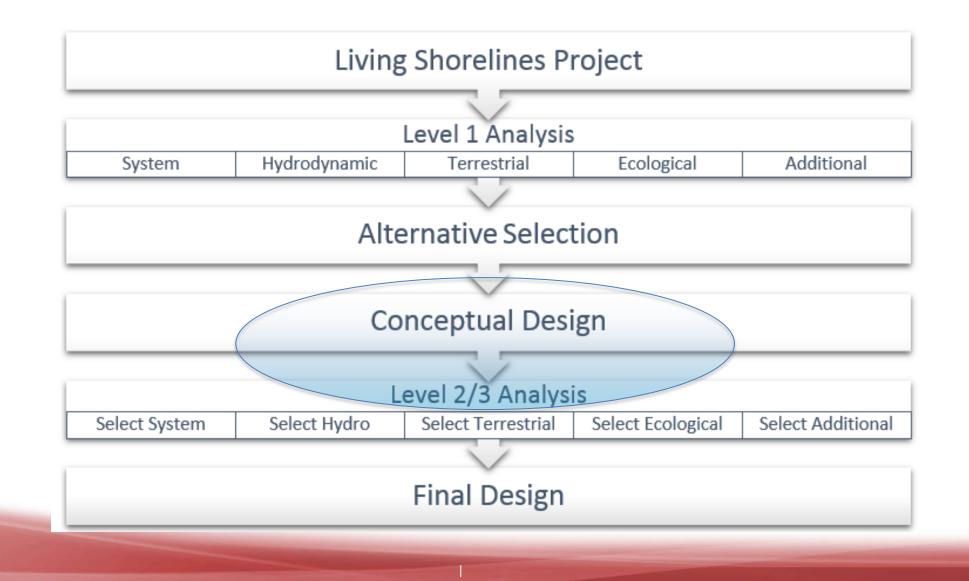

Bold denotes critical parameters requiring level 2/3 analysis

#### **Quantitative Interpretation**

- Based on guidance where established criteria
  - Only available for a limited number of parameters
  - Should be revisited on the basis of monitoring data

	Criterion								
Parameter	Low/Mild	Moderate	High/Steep						
System Parameters									
Erosion History	<2 <u>ft/yr</u>	2 ft/yr to 4 ft/yr	>4 <u>ft/yr</u>						
Sea Level Rise	<0.2 in/yr	0.2 in/yr to 0.4 in/yr	>0.4 in/yr						
Tidal Range	< 1.5 <mark>f</mark> t	1.5 ft to 4 ft	> 4 ft						
Hydrodynamic Parameters									
Waves	< 1 <u>ft</u>	1 ft to 3 ft	> 3 ft						
Wakes	< 1 <u>ft</u>	1 ft to 3 ft	> 3 <u>ft</u>						
Currents	< 1.25 kts	1.25 kts to 4.75 kts	>4.75 kts						
lce	< 2 in	2 in to 6 in	> 6 in						
Storm Surge	<1 👯	1 ft to 3 ft	>3 <mark>ft</mark>						

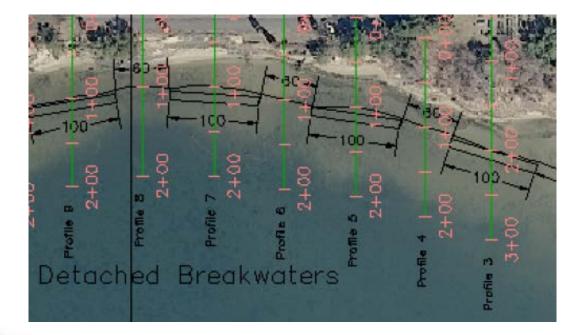

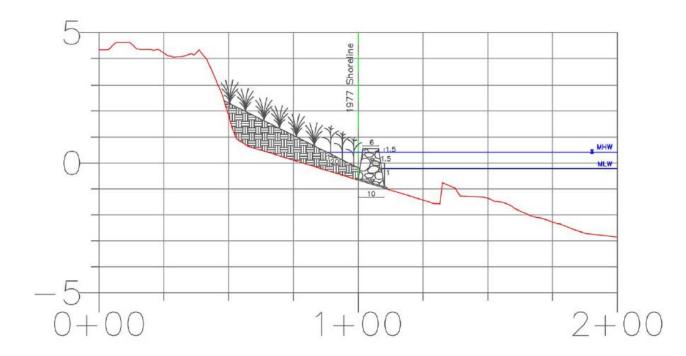

Call in La

STEVENS

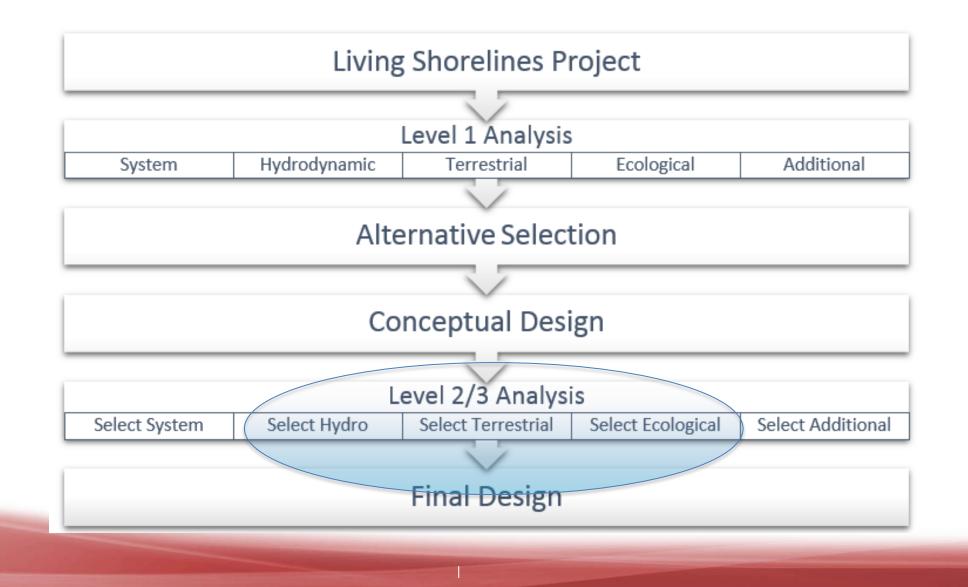

### **Conceptual Design**

• Plan and profile

Call in La

STEVENS

### Example: Wind Waves

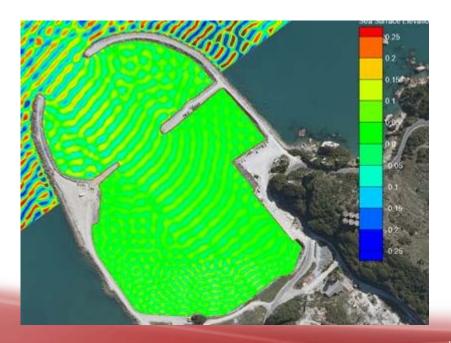

- Level 2 Analysis
  - Collect measurements
    - Provides real data at the site, but...
    - Consider factors like seasonality, etc.
    - Instrumentation
      - Pressure gauge
      - Accelerometer buoy
      - Acoustic wave gauge
      - Ultrasonic range measurement
      - Wave wire
      - Lidar/radar
      - Visual

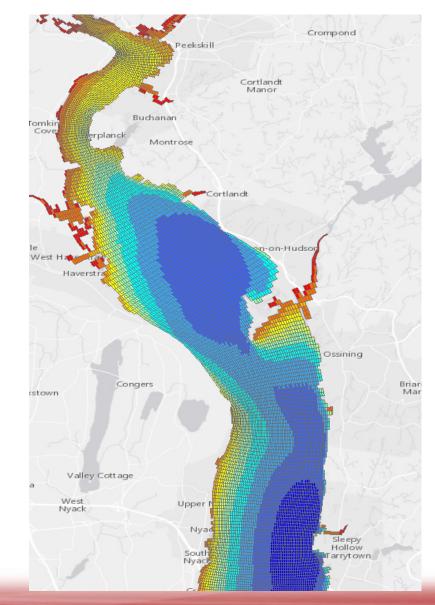

#### Example: Wind Waves

- Level 3 Analysis
  - Modeling
  - Can capture important bathymetric induced modifications to the wave field

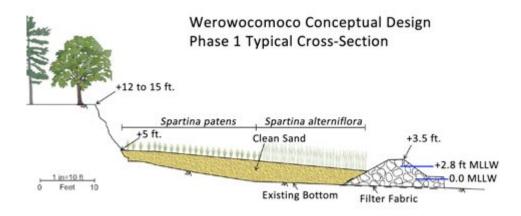

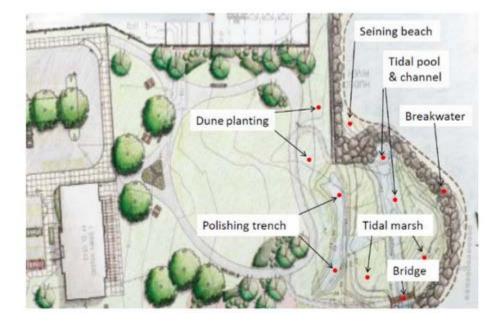

Call in La

STEVENS

# **Final Design**

• Plan, profile, detailed specifications

### Approach Specific Guidance

#### Marsh Sill

#### Description

Sills are low elevation typically stone structures that are constructed in the water parallel to the existing shoreline. Sills are often used as armoring for fringe marshes or wetlands that require a higher degree of protection. Sills dissipate wave energy and reduce bank erosion, causing waves to break on the offshore structure, rather than upon the natural, more fragile shore. Additionally, the tamed area of water lying behind the sill allows sand and sediment to accumulate between the structure and the shoreline. With time this process can eventually raise the elevation of the bottom and create a perched beach. This unique effect not only serves to further stabilize the shoreline or marsh behind the sill, but replaces lost and eroded land. Often the area between the sill and the shoreline is filled during construction to accelerate the development of the perched beach and planted with marsh plantings for stabilization.

Figure 7: Typical Sill

- Sill
- Revetment
- Breakwater
- Living Reef
- Reef Balls

#### Each Parameter Discussed

#### Hydrodynamic Parameters

#### Wind Waves

Approaches for designing marsh sills for wave heights range from the simple fetch based approaches presented in the main body of these guidelines, to more traditional engineering approaches based on a design wave height. Traditional engineering approaches for the design of rubble mound structures are discussed in the *Coastal Engineering Manual* (US Army Corps of Engineers, 2002) and *The Rock Manual* (CIRIA; CUR; CETMF, 2012). Relevant considerations include the geometry of the structure, the size of the armor units, the amount of energy dissipation, spacing (for segmented sills), and scour potential. The two most frequently used approaches to select the appropriate armor stone based on the structure geometry and the incident wave conditions are the (Hudson, 1959) and (Van der Meer, 1988) formulas.

# Parting Thoughts...

- Interest is staggering
- Need to find out what works for NJ
  - Unique urban environments
  - Ice?
  - Need to get projects on the ground
  - Monitoring will be critical
- Guidelines will need to be updated
